ABSTRACTED-PUB-NO: SU 1727773A

BASIC-ABSTRACT:

The feed additive comprises essential oil obtd. from bark of Siberian fir. (I) is obtd. by treatment of siberian fir bark, milled to particle size 3-5 mm, with live stream of temp. 130 deg.C, condensing vapours and sepg. organic phase from water. (I) contains above 66% of monoterpenes (mainly alpha-pinene, camphene, beta-pinene and beta-phellandrene (1(7),2-p-methadiene). Acidic fraction of (I) contains 80% of bornyl acetate while caryophyllene constitutes 50% of sesquiterpene fraction.

Tests show that the proposed additive, fed to piglets starting from 2 months of life for 125 days, increases digestibility of dry substances by 1.14-1.37%, organic substances by 1.12-1.29%, protein by 2.56-3.34% nitrogen-less extractive substances by 1.12-1.34% and fat by 3.06-3.92%, compared to the results obtd. for control gp. receiving no additive. Average daily wt. gain is increased by 9.9-14.1%. When the additive is fed to piglets starting from age of 4 months, it increases digestibility of dry substances by 0.05-1.79%, organic substances by 0.92-2.01%, protein by 2.64-3.08% and fat by 3.72-4.0%, compared to control gp., receiving no additive. Average daily wt. gain is increased by 2.4-8.6%. The additive has also bacteriostatic effect on intestinal microflora of piglets.

USE/ADVANTAGE - As a feed additive for piglets. The additive increases digestability of standard feed mixtures and shows bacteriostatic effect on intestinal microflora.
